

Vitamin B12 Treatment

Vitamin B-12 injections are used to treat patients who suffer from chronic fatigue, memory loss, and vitamin B-12 deficiencies.

Our medical staff provides specific testing to determine how significant your deficiency may be and will then prescribe a specialized treatment plan with B-12 dosages and supplementation. Patients also receive follow-up testing to monitor their progress.

B-12 injections are incorporated into our Weight Loss program on a weekly basis. An additional ingredient is used with B-12 injections to increase fat-burning potential for patients who are not allergic to Sulfa drugs.
